Application Deadlines View

1. THE PROBLEM

Students managing several job applications may need to track different dates: application closing dates, assessments, work samples, interviews and follow-ups. These details can appear in job listings, application pages and emails, making it difficult to see what needs attention next.

What we know: insiderOne already has My Pipeline and a Today experience, and some application journeys display individual work-sample deadlines. The opportunity is to make relevant dates easier to review together across tracked applications—not to build another application tracker.

Problem hypothesis: students may miss actions when deadlines are spread across application journeys. Validate this with student interviews and usability tests.

2. GOAL AND SUCCESS METRIC

Goal: help students identify their next application-related action and complete tracked tasks on time.

Primary metric — on-time task completion rate: number of eligible tracked tasks completed on or before their recorded due date ÷ all eligible tracked tasks due in the measurement period × 100.

Count late-completed tasks in the denominator, not the numerator. Exclude cancelled tasks. Exclude tasks with no usable due date and report their share separately. Log due-date edits; calculate against the last confirmed due date recorded before completion, and report edited-date tasks separately.

3. WHAT IT DOES — FIRST VERSION

Extend the existing **Today** experience with a deadline-focused view/filter; do not add a new top-level destination.

- Show linked items grouped as **Overdue, Today and Upcoming**, ordered by due date.
- Label the date type: application closing, assessment/work sample, interview or follow-up.
- Show company, role, action, due date, status and a link to the application in My Pipeline.
- Let students add or edit a missing date and its type; let them mark an actionable task complete.
- Keep task completion separate from application status: completing a work sample must not automatically move an application to another pipeline stage.

4. WHAT IT DOES NOT DO YET, AND WHY

- **No automatic extraction from every external site or email:** reliable access, coverage and date verification have not been established.
- **No replacement for My Pipeline:** reuse existing application records and statuses.
- **No separate calendar or complex task manager:** outside the narrow first-version problem.
- **No automatic reminders or external monitoring:** validate date quality and user value before adding more automation.

5. RISKS AND RESPONSES

- **Incorrect or outdated dates:** label each date as system/listing-sourced or student-entered; show source and last-updated time where available. Do not present unverified student-entered dates as verified. Allow correction and flag uncertain dates.
- **Duplicate items:** link each deadline to an existing application and check for an existing matching task before adding it.
- **Information overload:** prioritise overdue and near-term items; keep completed items out of the pending list.
- **Manual-entry friction:** reuse available application information and measure how often students add or edit dates.
- **Missed deadlines continue** track the share of participating students who miss at least one eligible tracked deadline as a guardrail.

6. HOW TO TEST BEFORE WIDER RELEASE

First, run moderated usability sessions with students managing multiple applications. Ask them to find the next deadline, identify an overdue task, distinguish an interview from an application closing date, add a missing assessment date and mark a task complete.

Then run a small, time-limited pilot and compare eligible task completion with a pre-pilot baseline. Monitor date accuracy, missing-date rate, task-entry completion, repeat use and the student-level missed-deadline guardrail. Set success thresholds before the pilot; treat results as directional if the sample is small.

Release decision: expand only if students can complete the key tasks reliably, date errors are acceptably low, and on-time completion improves without worsening the missed-deadline guardrail. Otherwise fix the specific failure and retest.
